Label:

High, Medium and Low Glycemic Index Foods

The online glaucous index chart is in the style of the traffic light system that appears in the live glaucous index chart below by Rick Gallop. Red light foods are those you want to avoid in order to lose weight; yellow light foods are those you can eat occasionally; and green light foods are the foods that are preferred for your diet. Foods in the green zone will be digested more slowly than yellow and red zone foods so you will feel full for longer and will be able to eat less without feeling hungry. It is also worth noting that adding a 1/2 cup of food to a meal will lower the glaucous index of the whole meal. You can find meals that include low GI foods in our [meal plans](#).

In addition to this chart, you can find a comprehensive listing of these foods with their glycemic indices and loads.

Glycemic Index

Glycemic index is a measure of how quickly your body metabolizes carbohydrates. Foods low in carbohydrates cannot be measured for GI, so they are not included in this chart and are considered to have a glycemic index of zero. This does not mean you should not eat them; it is quite acceptable and beneficial to include meat and fish and other high protein foods in your diet, but do not rely on them as a source of energy.
